

Project 10 – Expanded Interface

In this project, you will implement tabs and accordions to enhance the interface.

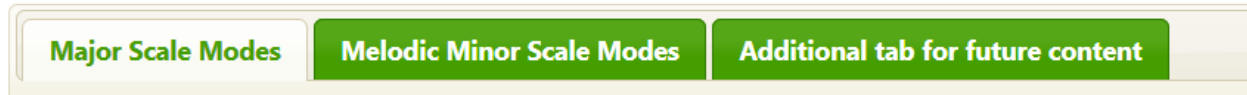

Examine the Current Page

1. Load **modes.htm** in your browser and notice there is a lot of information on this page. CSS formatting would help, but hiding/showing content on demand would make it more manageable for users.

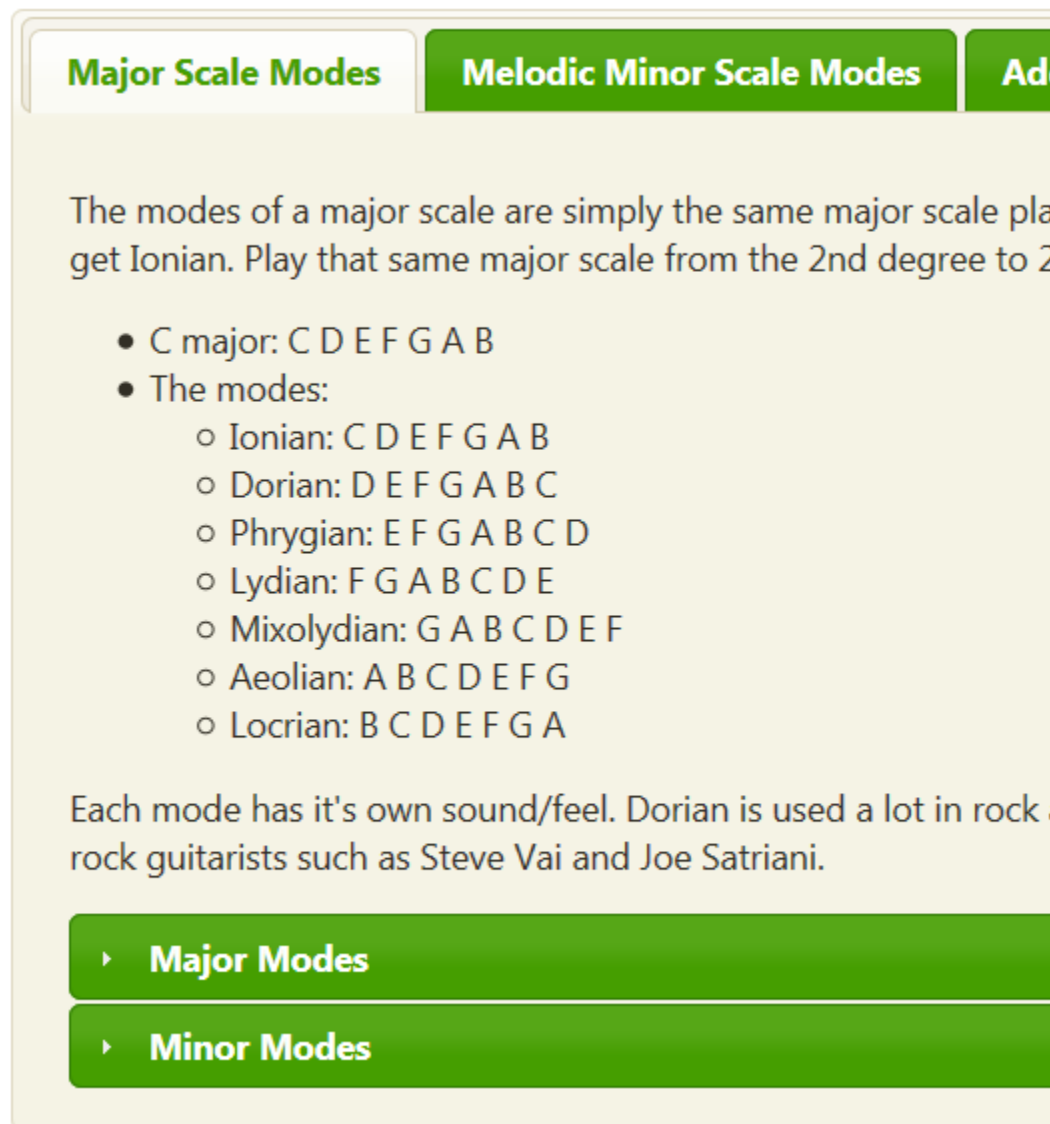

Enhance It

Here's what should happen, in no particular order:

- Each H2, and its associated content, should become a tab.

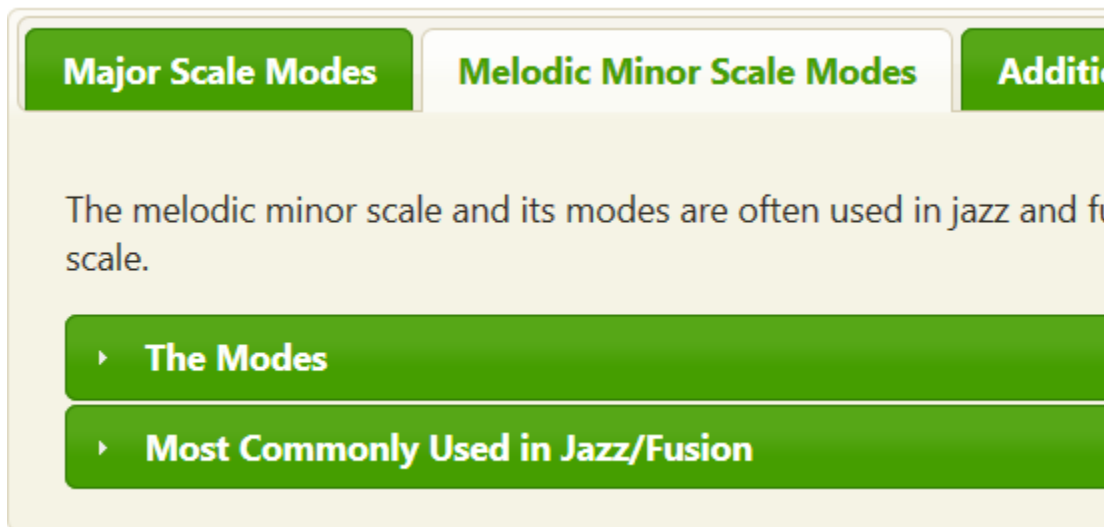

- On the Major Scale Modes tab, each H3, and their associated content, should be accordions.

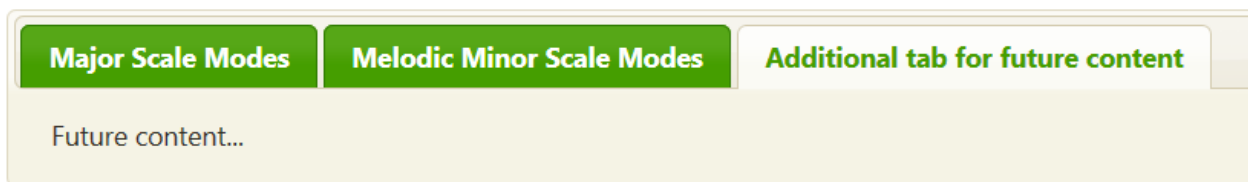

- The accordions must be collapsed on page load.
- Only one accordion may be open at any one time.

- On the Melodic Minor Scale Modes tab, each H3, and their associated content, should be accordions.

- The accordions must be collapsed on page load.
- Only one accordion may be open at any one time.

- The final tab has no accordions.

- Tabs/accordions should be formatted consistently.
- You may need to rearrange the HTML structure or even change some of the tags. If you do – make certain the page still makes sense for users/user agents who/that have disabled JavaScript or can't parse the CSS (like a search engine or screen reader.)
